Drought in the UK - we need your stories and experiences to inform future policy

Drought Risk and You

Droughts and water shortage affect us all through impacts on the environment, agriculture, infrastructure, society and culture.

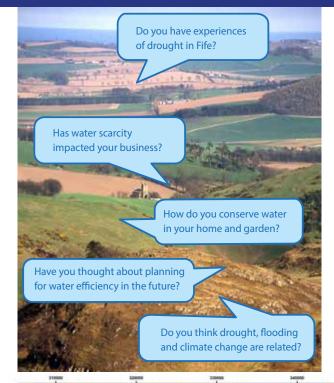

The Drought Risk and You (DRY) Project is looking at the impact of drought on seven river catchments in England, Wales and Scotland.

The project will exchange knowledge among communities in the catchment and drought scientists. In a series of workshops we will record the views of local people as they tell us their stories of drought and water-use.

We are working closely with local organisations to design the research and incorporate their expertise.

Did you know ...?

- A drought is a natural event usually resulting from prolonged shortage of rainfall.
- Droughts differ in their severity and impacts due to duration, physical geography and human uses of land and water.
- The most memorable drought in the UK was in 1976; a result of a dry winter followed by one of the hottest and driest summers on record.
- Drought can sometimes increase the risk of subsequent flooding, such as when heavy rainfall occurs after a drought has killed vegetation or very dry soil is unable to soak up rainfall.

Why the River Eden?

The Eden catchment is vulnerable to potential future changes in climate given the uses of its water resources:

- Irrigation of fruit, brassicas, potatoes and other root vegetables
- Abstractions from River Eden and boreholes
- Golf courses requiring irrigation
- Conservation interests dependent on protected wetlands

"Human beings are storytelling animals and by introducing storytelling into discussions about drought and water-use, we bring fresh, previously unheard voices into the conversation"

Michael Wilson (Loughborough University)
